- Conclusions

# Mesh Curving Method 

## Mesh Curving Method

1) Elevate elements to selected order.
2) Project surface nodes to true geometry.
3) Initialize interior nodes locations.
4) Apply smoothing to validate and improve quality.

Smoothing method performs optimization-based node perturbations to improve weighted cost function.

$$
\begin{gathered}
\mathrm{C}=\alpha C_{W}+\beta C_{J} \\
\alpha=\frac{\text { MAX(1,order }-1)}{\text { order }}, \beta=1-\alpha \\
C_{W}=\frac{V_{r}}{W C N} \quad \text { if } J_{s e}>0, \quad \text { else } C_{W}=J_{s e} \quad\left|\begin{array}{lll}
\sum \frac{\partial N_{i}}{\partial \xi} x_{i} & \sum \frac{\partial N_{i}}{\partial \xi} y_{i} & \sum \frac{\partial N_{i}}{\partial \xi} z_{i} \\
V_{r}=\operatorname{MIN}\left[1, \frac{V_{p}}{V_{c}}\right] \\
C_{J}=\operatorname{MNIN}\left[1, \frac{J_{p}}{\partial \eta} x_{i}\right. & \sum \frac{\partial N_{i}}{\partial \eta} y_{i} & \sum \frac{\partial N_{i}}{\partial \eta} z_{i} \\
\sum \frac{\partial N_{i}}{\partial \zeta} x_{i} & \sum \frac{\partial N_{i}}{\partial \zeta} y_{i} & \sum \frac{\partial N_{i}}{\partial \zeta} z_{i}
\end{array}\right|
\end{gathered}
$$

## Weighted Condition Number

- Measures the conformity to a specified shape, defined by W (coordinates taken from computational mesh).

$$
W C N=\frac{\left\|A W^{-1}\right\|\left\|W A^{-1}\right\|}{3}
$$

- A is the Jacobian matrix (coordinates taken from physical mesh).
- This is applied to the linear sub-elements of a higher order element.
- Value range is $0-1$.

## Latest CurveMesh Capability

- Incorporation of the volume ratio and second cost component eliminated negative Jacobians for more complicated cases.
- Negative Jacobians for P3 cases prior to modified method shown below.

## HiOCFD5 Cases

## Tandem Spheres

- Two mesh series created
- Unstructured tetrahedra
- Source shapes used to control resolution.
- Structured hexahedra
- Block topology created to allow similar control.

## Tetrahedral Meshes

## Mesh Topologies

- Single block unstructured tetrahedral mesh.
- Source shapes control resolution between and after spheres.
- Twenty block structured hexahedral mesh.

## P2 Mesh 1

- Plotted using ParaView
- 4 subdivision levels

## P1 Mesh 1

- Plotted using Pointwise

## P1 Mesh 6

- Plotted using Pointwise

## CRM-WB

- DPW 6 case
- P1 and P2 meshes for HiOCFD5
- Coarse, medium and fine (Following meshing guidelines from workshop)

## Geometry Issues

- Singularities in geometry definition caused curving issues.
- Fuselage tail
- Wing tip

## CRM-WB Mesh Series

| Mesh | \# Tets | P1 Nodes | P2 Nodes |
| :---: | :---: | :---: | :---: |
| Coarse | $2,498,519$ | 433,893 | $3,401,021$ |
| Medium | $4,776,832$ | 824,311 | $6,481,430$ |
| Fine | $10,700,893$ | $1,839,905$ | $14,493,243$ |

## P2 Coarse \& Medium

- Tail section
- Plotted using ParaView

Coarse
Medium

## Coarse P2

- Nose
- Wing Tip

## Coarse P2 Tail

- Plotted using ParaView.
- Truncated tail meshes not uploaded to HiOCFD5 website.

## Tiny \& Extra Tiny Added

- P1 and P2 all-tet meshes created in last couple of weeks.
- Coarsening reveals curved trailing edge.

## HL-CRM

- GMGW-1/HiLiftPW-3 workshop case
- Meshing guidelines provided by the two committees.

## Summary of grids generated:

| Case | Code(s) | Starting <br> Geometry <br> Model | Grid Type | Number <br> Grid Levels |
| :--- | :--- | :---: | :--- | :---: |
| HL-CRM full gap P1 | Pointwise, <br> CurveMesh | IGES | Unstructured Tetrahedra | 4 |
| HL-CRM full gap P2 | Pointwise, <br> CurveMesh | IGES | Unstructured Tetrahedra | 4 |
| HL-CRM full gap P3 | Pointwise, <br> CurveMesh | IGES | Unstructured Tetrahedra | 3 |
| HL-CRM full gap P1 | Pointwise, <br> CurveMesh | IGES | Unstructured <br> Prism/Tetrahedra | 4 |
| HL-CRM full gap P2 | Pointwise, <br> CurveMesh | IGES | Unstructured <br> Prism/Tetrahedra | 4 |
| HL-CRM full gap P3 | Pointwise, <br> CurveMesh | IGES | Unstructured <br> Prism/Tetrahedra | 3 |

- Pointwise used to create linear meshes
- All tetrahedral meshes created with Pointwise
- Recombination of tetrahedra in viscous region to form prisms
- WCN smoothing applied to eliminate extremely high included angles.
- CurveMesh used to elevate linear meshes to produce P2 and P3 meshes

THE CHOICE FOR CFD MESHING

## Surface Mesh Pictures (Medium-P1)

## Surface Mesh Pictures (Medium-P1) <br> PSInTMISE <br> THE CHOICE FOR CFD MESHING

## Extra Tiny P3

## Pêninvise

## Rotor 67

- Several meshes made in an attempt to create the series.
- Issues arose with kink in geometry of blade.
- Never completely resolved.
- Did not have a flow solver partner with periodic boundary condition capability in higher order codes.
- Higher priority tasks prevented work from continuing.

## Geometry and Surface Mesh

## Inflow \& Outflow Boundaries $\mathbf{P e m i n i v i s e ~}$

- UTC SimCenter extended the inflow and outflow boundaries and ran $2^{\text {nd }}$ order linear mesh solutions.

## $2^{\text {nd }}$ Order Flow Results

- Inflow and Outflow proximity can become an issue.

## Kink in Geometry

- Uncertain whether source is original CAD or in the transfer between formats.

# Meshing Philosophy 

## Meshing Philosophy

- A better quality linear input mesh will lead to successful curved mesh.
- Strive for surface AR < 200.
- Maintain similar spacing for edges emanating from same corner. (TE/LE Tip Root)
- Positive linear Jacobians and max included angles $\boldsymbol{\alpha}<179$.
- Resolve to sharp edges in linear mesh. Strive for reasonable resolution of curvature.
- Generating a coarse linear mesh is harder than a fine linear mesh.
- Curving a coarse mesh is much harder than a curving a fine mesh.

## Meshing Philosophy

- Geometry sometimes dictates resolution requirements.
- Trailing edge thickness is fixed.
- Streamwise and tangential spacing should be influenced by TE spacing.
- Curvature in multiple directions can impact the curving process.
- Tetrahedral elements in boundary layer result in extremely small included
 angles.
- Prismatic elements are easier to curve.

## Geometry Definition

- CRM WB Trailing edge shape is highly nonlinear with multiple inflections.

## Summary

- Mesh families with increasing resolution and order (P1, P2, P3 \& P4) created for multiple HiOCFD5 cases.
- Linear mesh quality impacts higher order mesh quality.
- Singularities and kinks in the geometry definition can get exposed in the curving process.
- Future CurveMesh development will permit mixed order meshes and H-P adaptation.
- Elevate only those elements that are necessary to resolve curvature, using the proper order (P2, P3, or P4).
- Enforce lower order shape on edges/faces common to elements of different order.
- On export, elevate mesh to requested order, dictated by user or solution adaptation.

## Acknowledgements

- This work was partially supported by a NASA Phase I SBIR, "High Order Mesh Curving and Geometry Access", NNX17CL83P.
- Collaboration with numerous flow solver developers has been extremely beneficial to advancing the mesh curving capabilities.
